

Received the first batch of files.

I've reviewed the complete set of documents you shared

(About/Contact/FAQ/Homepage/Inquiry templates, Beautiful 404/Tag Hub/Sitemap, ToC generator, Poll system with IP tracking, Key Takeaways with Schema.org, SEO URL cleanup, Jannah overrides, custom footer/chaty/scroll-top, post meta enhancer, author archive removal, feed control, etc.).

Quick Summary of the Codebase

- **Theme:** Heavy customization/overriding of **Jannah News** (RTL Persian academic services site for theses, articles, proposals, statistical analysis, etc.).
- **Key Features:**
 - Custom page templates (Homepage, Services, About, Contact, Inquiry/Order, FAQ).
 - Advanced ToC (auto H2-H4, dark/sepia, collapsible, schema-ready).
 - Poll system (single/multiple choice, IP voting, results animation).
 - FAQ with Schema.org JSON-LD.
 - Beautiful 404 with content hub (popular posts, categories, tags).
 - Tag Hub & Visual Sitemap pages.
 - Inquiry form with multi-recipient emails, file upload, rate limiting, user confirmation.
 - Enhanced post meta (badges, difficulty levels, compact layout).
 - Key Takeaways section with live preview in admin.
 - SEO tools (clean tracking params, canonicals, noindex for spam feeds, author archive removal).
 - Dark/Sepia modes + accessibility (skip link, reduced motion, high contrast).
 - Font Awesome 7 Pro integration (with webfont fallbacks).
 - Performance (critical CSS, content-visibility, preload).
- **Constants** defined in Core PHP Functions (phone, WhatsApp, email, logo, etc.).
- **Some files are truncated** (ToC CSS/JS, Complete CSS, Inquiry handler, JS file, Homepage render).

Next Steps

Awaiting the **next series of files** (probably the missing/truncated parts like full Homepage render, Services template, remaining JS/CSS, any additional plugins). Once I have everything, I can:

1. **Merge & complete** all files into a functional theme/plugin package.
2. **Fix bugs** (missing functions, duplicate code, Jannah conflicts, PHP notices).
3. **Security/performance audit** (rate limiting, sanitization, nonce checks look good but I can verify).
4. **Test & optimize** (RTL, mobile, dark mode, Schema validation).
5. **Deployment guide** or zip the full theme.

What do you need first?

- Full integration / bug fixes?
- Specific file completion (e.g., truncated ToC or Homepage)?
- Security review?
- Performance tweaks?
- Anything else?

Just paste the next batch whenever ready — I'm ready to build the complete working site with you.
